

### INSTRUCTIONS FOR USE AND DATA SHEET

The precision chamfer is used to plane, adapt and chamfer the cut edges of designer coverings.

To-and-fro movements of the loose blade holder (2) adjust the blade (3) to the required cutting depth.

The required thickness of the covering is adjusted using the adjustment screws (4) on the guide.

For planing and adapting the cut edges, the straight guide is used and for chamfering, the slanted guide is used (illustration below).
